

Quercetin, a flavonoid in onions and apples

What do you *actually* know about the plant compounds in your food?

A name is a starting point. The fuller picture takes a few more questions.

A name is only a *starting point.*

Quercetin

Resveratrol

Chlorogenic acid

Catechin

Ellagic acid

Anthocyanins

Curcumin

You have seen them on labels, in headlines, maybe on a supplement bottle. **On their own, they say very little** about what happens once that compound is on your plate.

The Encyclopedia of Polyphenols

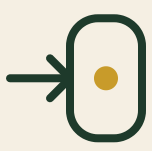

Four questions that help →

Four questions that build a *fuller picture*

01 

Food sources

Where does the compound actually show up, and in what amounts?

02 

Absorption

How much of it makes it past the gut and into the bloodstream?

03 

Metabolism

What does the body turn it into, and is that what the studies measured?

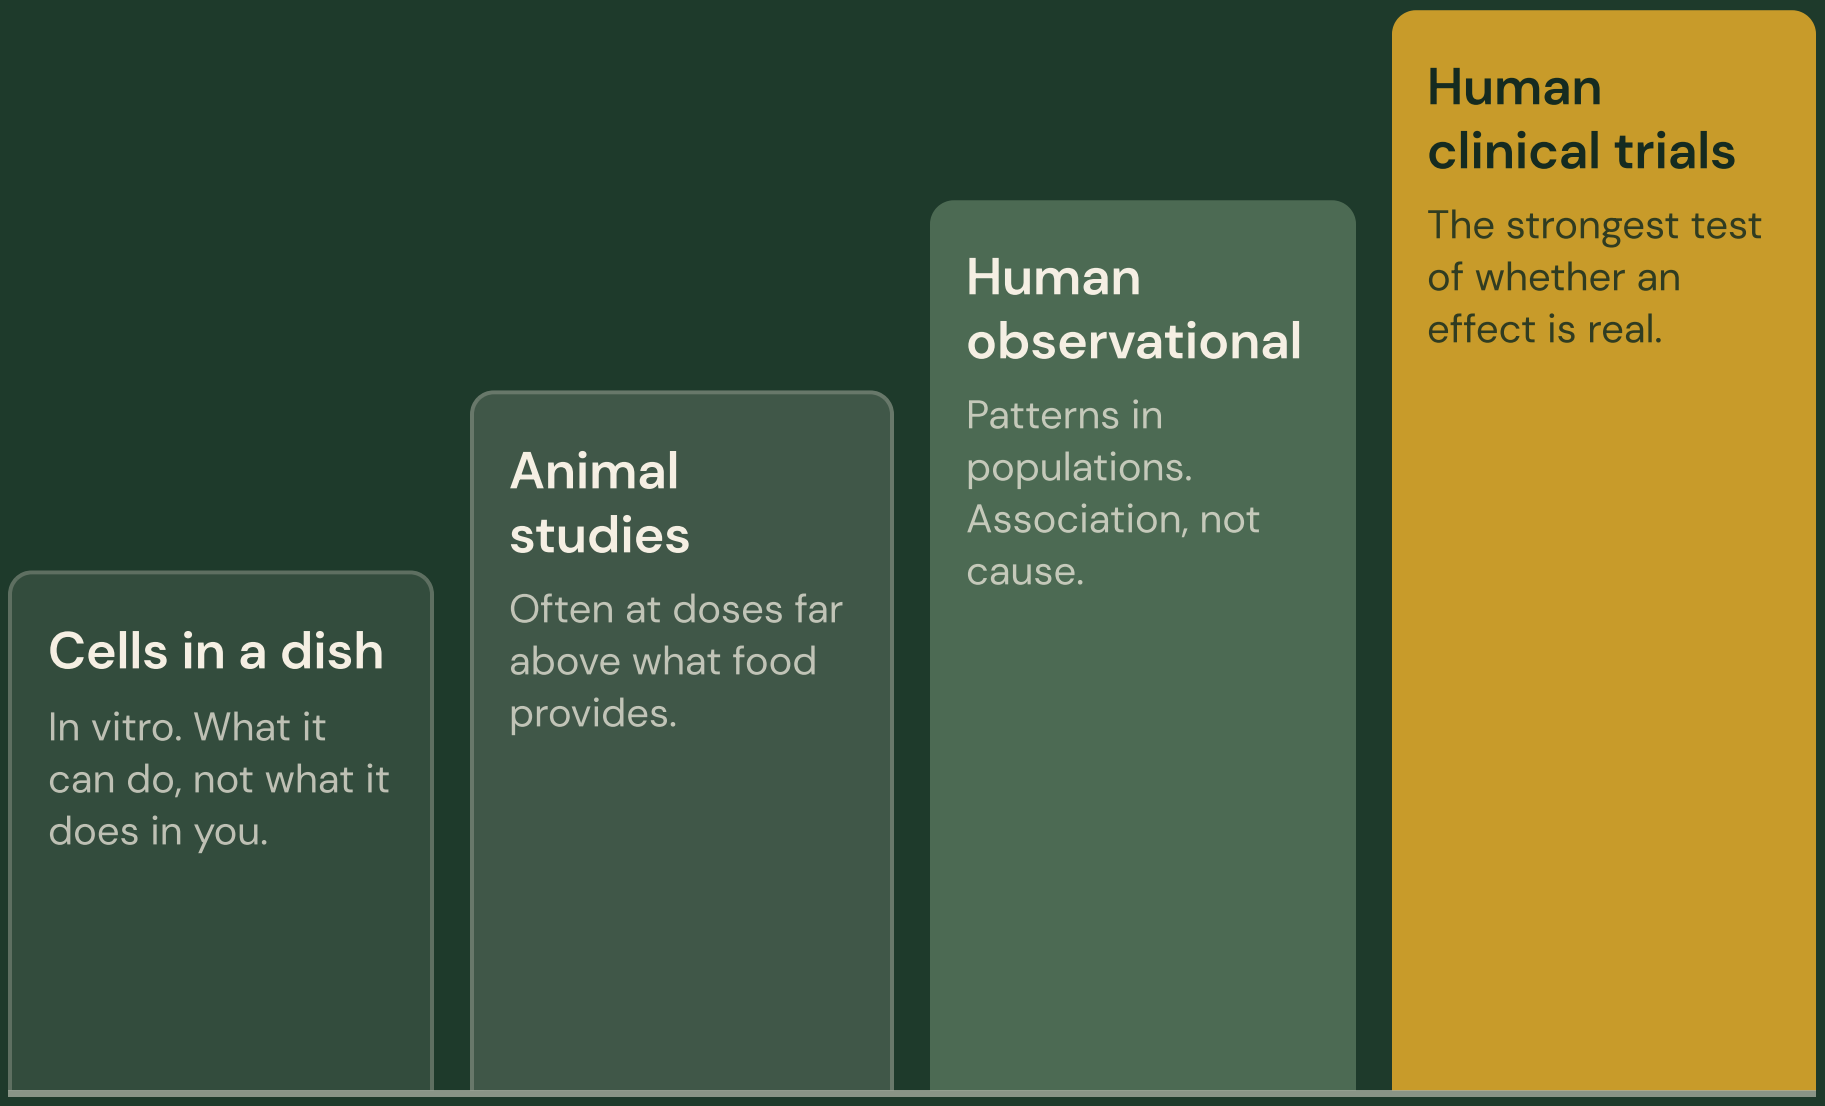

04 

The research

Is the claim built on a lab dish, an animal study, or a human trial?

Not all evidence *weighs the same.*

A compound that looks promising in a petri dish has a long way to go before it means anything for the person eating it.

A headline rarely says which step a claim came from. **A good reference does.**

The Encyclopedia of Polyphenols

Not one thing →

Polyphenols are not *one thing.*

Thousands of known compounds, grouped into a handful of major families. Four of the biggest:

Flavonoids

The largest family. **Tea, berries, onions, cocoa, citrus, apples.**

QUERCETIN · CATECHINS

Phenolic acids

Everyday staples. **Coffee, whole grains, berries, plums.**

CHLOROGENIC · FERULIC ACID

Stilbenes

A small family with a famous member. **Grapes, red wine, peanuts.**

RESVERATROL

Lignans

Found in seeds and grains. **Flaxseed, sesame, whole grains.**

SECOISOLARICIRESINOL
